- Description of the replication files for "Trade Flows and Fiscal Multipliers"
 - by Matteo Cacciatore and Nora Traum
 - Review of Economics and Statistics
 - Updated: October 7, 2020

- These codes call and use Dynare. To reproduce the codes, one must first have Dynare installed.
 - The results of the paper were run on Dynare Version 4.4.3 and Matlab 2016b.
-
-

Figure 2 & Table 1 (prior-predictive analysis, section 3 of the paper):

Run the file run_priorpredictive.m in the "prior predictive analysis" folder. This file takes draws from the priors and computes present value multipliers and probabilities of observing various multipliers (i.e., reproduces Table 1 and Figure 2). Computation results are saved in the mat_files subfolder.

The script calls a series of functions that are contained within the same folder, most importantly:

- get_prior_draw: This code takes draws from the priors for parameters
 - calibrate_bkk_for_estimation: Gives calibration for some parameters and calls steady-state solver codes
 - steadyBKK: sets up the steady-state of the model
 - steadyBKK_solver: function called by steadyBKK.m to solve for a specific set of steady state parameters.
 - newsteadyBKK: sets up the steady-state of a counterfactual model (i.e., closed economy)
 - newsteadyBKK_solver: function called by newsteadyBKK.m to solve for a specific set of steady state parameters.
 - display_results: displays results for Table 1 and makes Figure 2
 - BKKexp.mod: Dynare file with open-economy model
 - BKKexp_closed.mod: Dynare file with closed-economy model
-
-

Figure 3 (analysis using the estimated model, section 4 of the paper):

Run the file runme.m in the "estimation and posterior analysis" folder. This file will find the posterior mode, perform the Metropolis-Hastings algorithm, and save and report basic statistics about posterior draws.

The script calls a series of functions that are contained within the same folder (several are referenced in the section above and for brevity are not repeated here), most importantly:

- CanadaUSdata.xls: Contains all the data for the US and Canada; see the online appendix for more information about manipulations from original source files to final data format. All manipulations are contained in the excel file.
- get_data.m: loads data in final form for estimation.
- priors.m: Calculates weight from priors

- `calculate_likelihood.m`: Solves model and calculates the likelihood value using the Kalman filter
 - `MHalgorithm.m`: runs the Metropolis-Hastings algorithm for a given posterior mode
 - `kalman_restrictedstate.m`: Kalman filter code adapted from Dynare
 - `run_posteriorpredictive.m`: calculates open- and counterfactually closed-economy multipliers
 - `display_results`: displays results for Figure 3
-
-

Figure 4 (model counterfactuals, section 4 of the paper):

Run the file `run_posteriormean_counter.m` in the “counterfactual posterior analysis” folder to reproduce the counterfactual analysis at the posterior mean (i.e., to generate Figure 4 in the paper).

The script calls a series of functions that are contained within the same folder:

- `calibrate_bkk_for_estimation`: Gives calibration for some parameters and calls steady-state solver codes
- `steadyBKK`: sets up the steady-state of the model
- `steadyBKK_solver`: function called by `steadyBKK.m` to solve for a specific set of steady state parameters.
- `newsteadyBKK`: sets up the steady-state of a counterfactual model (i.e., closed economy)
- `newsteadyBKK_solver`: function called by `newsteadyBKK.m` to solve for a specific set of steady state parameters.
- `lrfs`: compute impulse response functions
- `BKKexp.mod`: Dynare file with open-economy model
- `BKKexp_closed.mod`: Dynare file with closed-economy model
